

Linux Commands Quick Reference Guide

Cloud Computing Course

Prepared by: Imran Sayyed (Course Instructor)

This document contains Linux commands covered in class, assignments, tests, and additional commands useful for cloud computing, system administration, and shell scripting.

pwd – Displays the current working directory.

ls – Lists files and directories.

ls -l – Displays detailed file information.

ls -a – Shows hidden files and directories.

cd – Changes the current directory.

cd .. – Moves one directory level up.

cd ~ – Moves to the home directory.

mkdir – Creates a new directory.

rmdir – Deletes an empty directory.

touch – Creates an empty file.

cp – Copies files or directories.

mv – Moves or renames files/directories.

rm – Deletes files.

rm -r – Deletes directories recursively.

clear – Clears the terminal screen.

cat – Displays file contents.

grep – Searches text using patterns.

find – Searches for files and directories.

chmod – Changes file or directory permissions.

chown – Changes file ownership.

chgrp – Changes file group ownership.

whoami – Displays the current logged-in user.

id – Displays user and group information.

groups – Shows groups assigned to a user.

sudo – Executes commands with administrative privileges.

echo – Prints text or variable values.

read – Accepts input from the user.

env – Displays environment variables.

export – Creates or updates environment variables.

history – Displays command history.

man – Displays manual/help pages.

ps – Shows currently running processes.

top – Displays real-time process monitoring.

kill – Terminates a running process.

kill -9 – Forcefully terminates a process.

cron – Background service responsible for scheduled jobs.

crontab -e – Opens the cron job editor.

hostname – Displays the system hostname.

ping – Checks network connectivity.

ip addr – Displays IP address configuration.

ifconfig – Displays network interface information (legacy).

df -h – Displays disk usage in human-readable format.

du -h – Displays directory/file size usage.

free -h – Displays memory usage information.

gzip – Compresses files using gzip.

tar – Archives multiple files into a single file.

wget – Downloads files from the internet.

curl – Transfers data to or from servers.

nano – Simple terminal text editor.

vi – Advanced terminal text editor.

ssh – Securely connects to a remote Linux server.

scp – Securely copies files between systems.

service – Starts, stops or checks services.

systemctl – Manages services in systemd-based systems.
